Preventing Obesity

Breastfeeding Support in Child Care

Nearly 5 out of 6 (82.4%) New Hampshire mothers start breastfeeding after delivery, but only 2 out of 6 (31.3%) continue until the baby is 1 year old. Child care is an important setting to support mothers to successfully continue breastfeeding.

- Supporting breastfeeding in child care promotes healthy babies, mothers, and communities – and saves money.¹
- Work status impacts breastfeeding. Studies show that women who plan to return to work before their baby’s first birthday, are less likely to start breastfeeding. Mothers who work full time tend to breastfeed for a shorter duration than do part-time or unemployed mothers.²
- In the US, half of all mothers of infants are employed. Nearly 70% of them work full time. Most of those mothers return to work by the time their baby is six months old.²
- Nearly 13,000 babies were born in New Hampshire in 2010.³ More than 9,000 (about 70%) NH mothers with infants are working.⁴

Child Care Policies That Support Breastfeeding Mothers

- **Train all staff** on the benefits of breastfeeding and how to support breastfeeding families.¹ ⁵
- **Offer a place** (other than a bathroom) for mothers to breastfeed in privacy (if desired).¹ ⁵ Make it clear to mothers, staff, and other parents that according to NH RSA 132:10-d, breastfeeding a child in New Hampshire is not indecent exposure, and it is discriminatory to limit the right of a mother to breastfeed.⁶
- **Follow proper handling guidelines** for storage, preparation and feeding of breastmilk to assure each infant is only given their mother’s breastmilk and the milk is kept clean and safe.¹ ⁵
- **Feed infants on demand.¹ ⁵**
- **Inform families and staff** that the child care program is committed to and supportive of breastfeeding.¹ ⁵
- **Provide accurate breastfeeding materials** to families and staff.¹ ⁵
- **Provide a welcoming atmosphere** that encourages mothers to choose and continue to breastfeed.¹ ⁵

Why Breast Milk?

- Human milk is the ideal food for babies.²
- Risks associated with formula feeding:
  - 32% increased risk for obesity later in life
  - Hospitalizations for lung infections
  - Diarrhea and vomiting
  - Ear Infections
  - Asthma
  - Type 2 diabetes
  - Eczema
  - Sudden infant death syndrome (SIDS)
National Breastfeeding Recommendations

Six months of exclusive breastfeeding (only fed breast milk) reduces risk of obesity in children. The American Academy of Pediatrics recommends breastfeeding for at least the first year of life to provide a full range of health protections.

Healthy People 2020 is a set of national health objectives created by the US Department of Health and Human Services. New Hampshire has exceeded two of the objectives: babies ever breastfed and exclusive breastfeeding through 3 months.
